f_11-18.mcd

$i := 0..127 \quad j := 0..64 \quad s := 0..64 \quad f_{\max} = 64 \quad A = 30 \quad N0 = 1 \quad C = 1 \quad \sigma1 = 20 \quad \tau1 = 0 \quad \sigma2 = 21 \quad \tau2 = 0$

Define signal and noise spectra and the MTF:

$$P_{S_j} := A \cdot \exp \left[\frac{-(j - \tau_1)^2}{2 \cdot \sigma_1^2} \right] \quad P_{N_j} := N0 \quad F_s := \left(\frac{1}{.571} \right) \cdot \left(\cos \left(\frac{s}{65} \right) - \sin \left(\cos \left(\frac{s}{65} \right) \right) \right)$$

And the Wiener filter transfer function is:

$$H_j := \frac{F_j \cdot P_{S_j}}{(F_j)^2 \cdot P_{S_j} + P_{N_j}}$$
